

Jupyter Notebook Execution Report

Name: Group 6
Project Title: Lab1
Date: September 25, 2026

Cell 1: ■ Markdown

****ENEE 408I: Lab 3****

Group 6

Martin Haralanov, Jaime Gomez, Nick Betters, Mark Phelps

[Github](https://github.com/M-Haralan/ENEE408I)

Cell 2: ■ Markdown

****`3.1: Part A - Analyzing Audio Signal and Downsampling`****

Cell 3: ■ Markdown

1. Switch to your virtual environment

Cell 4: ■ Markdown

2. Read the wav file "human_voice.wav" and write down its original sampling frequency.

Cell 5: ■ Code

```
from scipy.io import wavfile

fs, audio = wavfile.read('human_voice.wav')

print("Original sampling frequency:", fs, "Hz")
```

Output:

Original sampling frequency: 48000 Hz

[STDERR]

/usr/lib/python3/dist-packages/scipy/__init__.py:146: UserWarning: A NumPy version >=1.17.3 an

```
warnings.warn(f"A NumPy version >={np_minversion} and <{np_maxversion}")
```

Cell 6: ■ Markdown

3. Plot the signal using matplotlib.

Cell 7: ■ Code

```
import matplotlib.pyplot as plt
import numpy as np

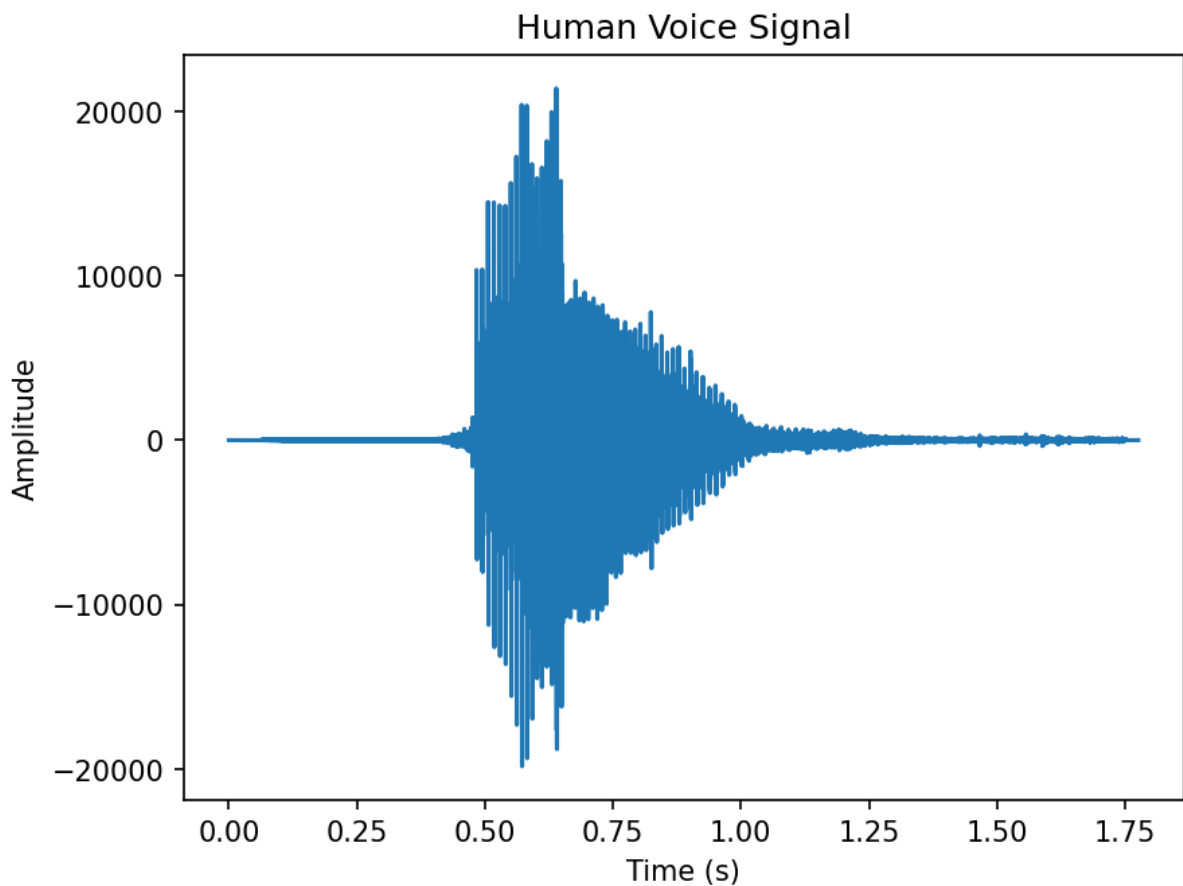

time = np.arange(len(audio)) / fs

plt.plot(time, audio)
plt.xlabel("Time (s)")
plt.ylabel("Amplitude")
plt.title("Human Voice Signal")
plt.show()
```

Output:

```
[STDERR]
```

```
&string&;1: UserWarning: Matplotlib is currently using agg, which is a non-GUI backend, so
```

Cell 8: ■ Markdown

4. Downsample the audio file to 8kHz without using inbuilt functions.

Cell 9: ■ Code

```
target_fs = 8000

# Calc downsampling ratio
ratio = fs // target_fs

# downsample by taking every nth sample
audio_downsampled = audio[:,ratio]

print("Original sampling frequency:", fs, "Hz")
print("New sampling frequency:", target_fs, "Hz")
```

Output:

```
Original sampling frequency: 48000 Hz
```

New sampling frequency: 8000 Hz

Cell 10: ■ Markdown

5. How many audio samples were obtained after downsampling?

Cell 11: ■ Code

```
print("Number of samples BEFORE downsampling:", len(audio))
print("Number of samples AFTER downsampling:", len(audio_downsampled))
```

Output:

```
Number of samples BEFORE downsampling: 85248
Number of samples AFTER downsampling: 14208
```

Cell 12: ■ Markdown

6. Plot the downsampled signal using matplotlib.

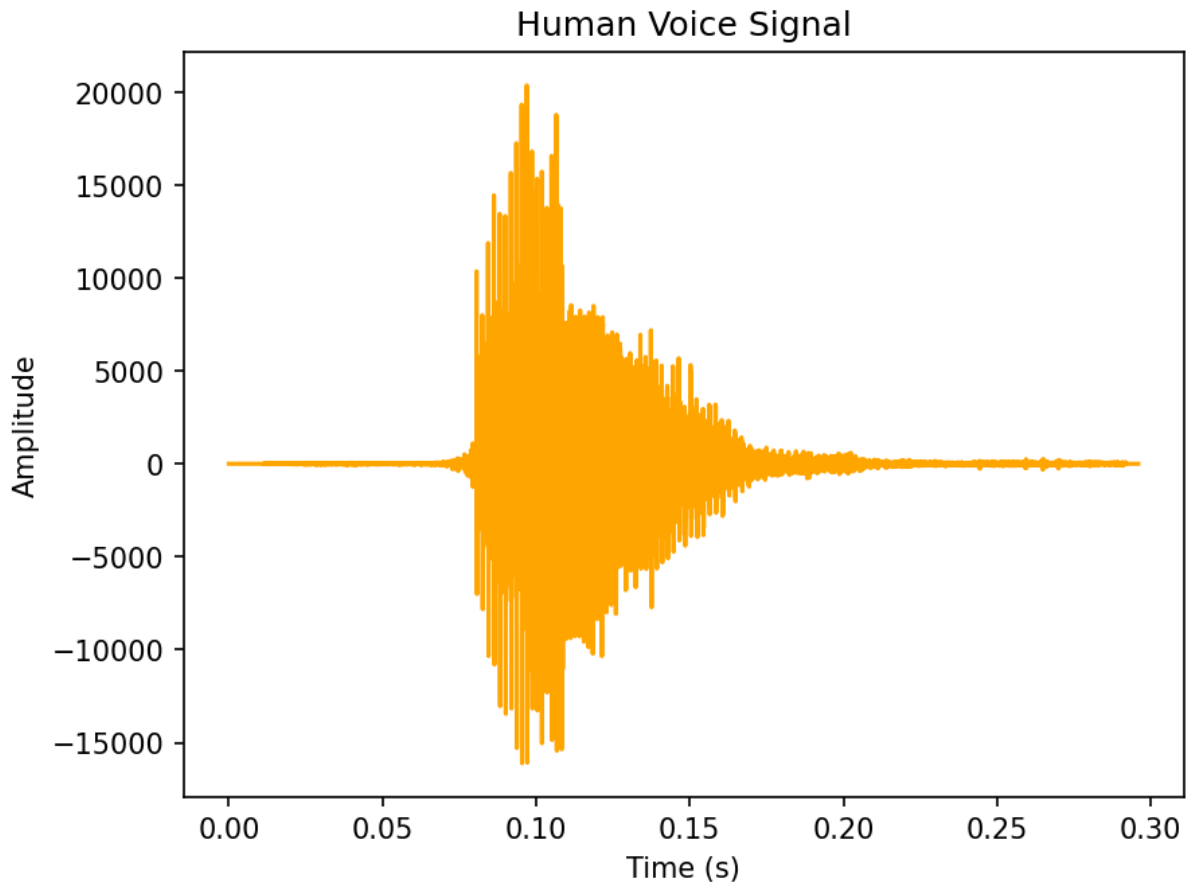

Cell 13: ■ Code

```
time = np.arange(len(audio_downsampled)) / fs

plt.plot(time, audio_downsampled, color='orange')
plt.xlabel("Time (s)")
plt.ylabel("Amplitude")
plt.title("Human Voice Signal")
plt.show()
```

Output:

```
[STDERR]
<string>:1: UserWarning: Matplotlib is currently using agg, which is a non-GUI backend, so
```

Cell 14: ■ Markdown

7. Observe a section of the audio signal corresponding to the same time period (hint: think of the sampling ratio and select two starting and ending points). What differences do you notice?

Cell 15: ■ Markdown

The downsampled signal has fewer points, but still has roughly the same overall shape. At 8 kHz, it has 1/6 as many samples as the original 48 kHz signal.

Cell 16: ■ Code

```
# Same time period for both signals
start_time = 0.09
end_time = 0.10

# Original signal
start_original = int(start_time * fs)
```

```

end_original = int(end_time * fs)

# Downsampled signal
start_down = int(start_time * target_fs)
end_down = int(end_time * target_fs)

plt.figure(figsize=(10, 4))

plt.plot(np.arange(start_original, end_original) / fs,
audio[start_original:end_original], label="Original (48 kHz)")

plt.plot(np.arange(start_down, end_down) / target_fs,
audio_downsampled[start_down:end_down], label="Downsampled (8 kHz)")

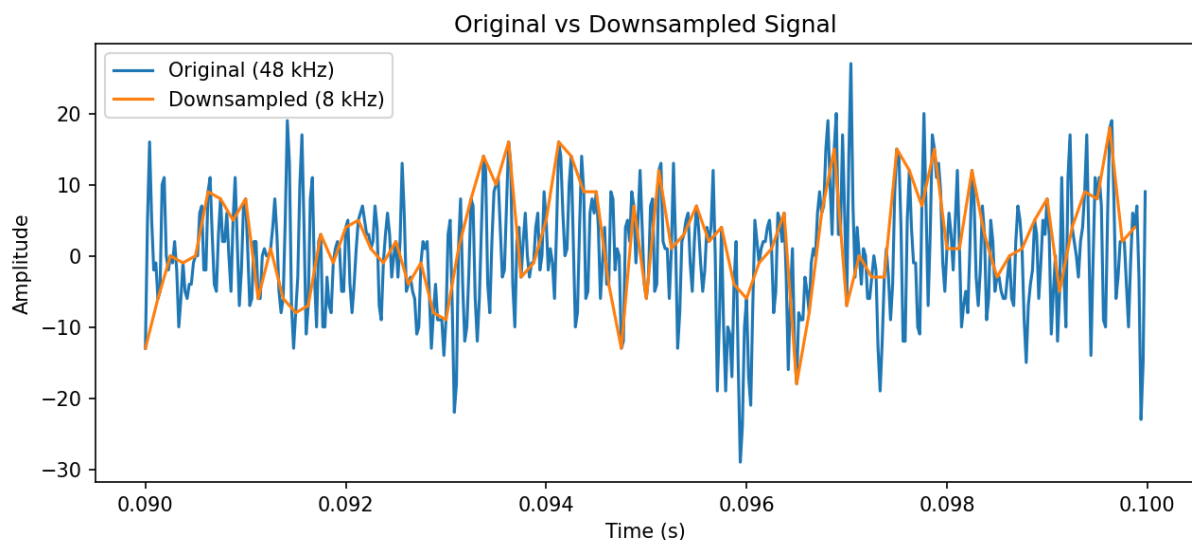

plt.xlabel("Time (s)")
plt.ylabel("Amplitude")
plt.title("Original vs Downsampled Signal")
plt.legend()
plt.show()

```

Output:

[STDERR]

<string>;1: UserWarning: Matplotlib is currently using agg, which is a non-GUI backend, so

Cell 17: ■ Markdown

****3.2: Part B - RMS, Cross-Correlation, and Sound Localization****

Cell 18: ■ Code

```
from scipy.io import wavfile
import numpy as np

fs1, M1 = wavfile.read('M1.wav')
fs2, M2 = wavfile.read('M2.wav')
fs3, M3 = wavfile.read('M3.wav')

M1 = M1.astype(float)
M2 = M2.astype(float)
M3 = M3.astype(float)
M1_RMS = np.sqrt(np.mean(M1**2))
M2_RMS = np.sqrt(np.mean(M2**2))
M3_RMS = np.sqrt(np.mean(M3**2))
print(f"RMS of M1: {M1_RMS}")
print(f"RMS of M2: {M2_RMS}")
print(f"RMS of M3: {M3_RMS}")
```

Output:

```
RMS of M1: 7383.243593119038
RMS of M2: 5906.3835785917545
RMS of M3: 7383.243593119038
```

Cell 19: ■ Markdown

M1 has a higher RMS than M2, so the amplitude of the audio must be higher, thus M1 is closer.

Cell 20: ■ Code

```
def cross_corr(x, y):
    nx = len(x)
    ny = len(y)

    out_len = nx + ny - 1
    out = np.zeros(out_len)
    x_padded = np.pad(x, (ny - 1, ny - 1), mode='constant', constant_values=0)
```
